

# Java Exception Class Hierarchy

---

## Following is the hierarchy of the Java Exception Classes:

- In Java, the throwable class is the parent class of all exception classes.
- There are two child classes in the throwable class, i.e., Error and Exception.
- The Exception class represents exceptions that the programmer can handle using the try-catch block.
- RuntimeException is a class that is a subclass of the Exception class and comprises the majority of the unchecked exceptions. Unchecked Exceptions include ArithmeticException, NullPointerException, NumberFormatException, etc.
