

## 2. Iterator Interface

**Iterator interface:** Iterator is an interface that iterates the elements. It is used to traverse the list and modify the elements. Iterator interface has three methods which are mentioned below:

<code>Public void remove()</code>	This method removes the last elements returned by the iterator.
<code>public Object next()</code>	It returns the element and moves the cursor pointer to the next element.
<code>public boolean hasNext()</code>	This method returns true if the iterator has more elements.
